---

### Education

---

Carnegie Mellon University

*Ph.D. Mechanical Engineering (2016)*

Advisors: Jonathan Cagan, Kenneth Kotovsky

Dissertation: *Designing the Characteristics of Design Teams via Cognitively-Inspired Computational Modeling*

*M.S. Mechanical Engineering (2014)*

Advisors: Jonathan Cagan, Kenneth Kotovsky

California State University, Fresno

*B.S. Mechanical Engineering (2012)*

*B.S. Civil Engineering (2012)*

---

### Licensure and Certifications

---

Future Faculty Program (estimated completion February 2017)

*Carnegie Mellon University*

Workshops:

Course and Syllabus Design

Promoting Peer Learning

Planning and Delivering Effective Lectures

Leveraging Diversity and Promoting Equity

Engaging Students in Active Learning

Guiding Attention and Memory

Early Course Feedback Focus Group, completed October 11, 2016

Classroom Observation, completed October 13, 2016

Co-Curricular Leadership Certificate (2012)

*California State University, Fresno*

Program pillars:

Ethical Decision-making

Service-learning

Community Engagement

Diversity Awareness

Effective Communication

Team Dynamics

Engineering-in-Training Certification (2010)

*State of California*

Registration No. 139223

---

### Research Experience

---

Postdoctoral Research Associate

*Carnegie Mellon University (August 2016 – Present)*

Current research investigates ways to simulate team performance on problems that involve more conceptual design. This focuses on computationally modeling design problems that require functional design (without commitment to specific physical components) followed by instantiation design (which requires the selection of components based on desired functions).

I have also investigated extensions that apply the methodology from my dissertation to the prediction of optimized parameters for design algorithms based on problem properties.

#### Graduate Researcher

*Carnegie Mellon University (August 2012 – August 2016)*

My dissertation research focused on understanding and quantifying the relationship between the properties of design problems and the best team structures for solving those problems. I first created a computational model of engineering design teams, and validated this model through direct comparison to the results of a human study. Next, I leveraged the computational efficiency of the model to simulate the performance of many different teams on many different design problems. Conducting analysis on the results of these simulations resulted in a set of equations that make it possible to predict optimized team characteristics based on measurable problem properties. Finally, I validated the predictions made using these equations through a second human study, revealing novel insights into how teams should be designed for different types of problems. Side projects included research into computational social choice, statistical models of designer behavior, and both deterministic and stochastic optimization.

#### Scientific Undergraduate Laboratory Intern

*National Renewable Energy Laboratory (May 2012 – August 2012)*

This project focused on the efficient simulation of wave energy converters using frequency-domain analysis techniques. I developed a computational tool for modified frequency-domain analysis that readily allowed for the incorporation of nonlinear control strategies and nonlinear fluid interactions.

#### Undergraduate Research Assistant

*California State University, Fresno (May 2011 – May 2012)*

This research sought to demonstrate that common mechanical fasteners can be used to increase the strength of composite structural decks (which common in industrial and multi-family construction). Both experimental and analytical results showed an increase in strength with the addition of these embedded fasteners.

#### Scientific Undergraduate Laboratory Intern

*National Renewable Energy Laboratory (May 2011 – August 2011)*

Working within OpenFOAM (an open-source computational fluid dynamic program), I developed tools to aid in the simulation of wave energy converters. Specifically, I developed tools that made it possible to simulate power generation within a wave energy device and the effects of mooring lines.

## Teaching Experience

---

#### Instructor: Grand Challenges Innovation

*Carnegie Mellon University (Spring 2017)*

This new graduate level course will be offered as part of the Masters of Science in Technology Ventures. In the course, graduate students will learn how to leverage principles of innovation and emerging technologies to solve complex societal problems. This course is currently under development and will be co-taught with Jonathan Cagan.

**Instructor: Integrated Product Conceptualization***Carnegie Mellon University (Fall 2016)*

This undergraduate course gives students an opportunity to learn about the design of products and services within interdisciplinary teams via the integrated new product development process. I chose to feature a semester-long design project with the theme of “Innovating for Accessible Health and Fitness”. In designing the course, I have integrated reflection-based, competition-based, and project-based assessments and activities in order to improve concept retention.

**Teaching Assistant: Integrated Product Development***Carnegie Mellon University (Spring 2014)*

My role as a teaching assistance for this graduate capstone course involved meeting with the instructors to refine and pre-record lectures with the goal of partially “flipping” the classroom. I edited these recordings into final lectures and made them available to students.

**Teaching Assistant: Numerical Methods***Carnegie Mellon University (Fall 2013)*

As a teaching assistant for this graduate course, I graded assignments, held regular office hours, and assisted students in developing their final course projects. The course topics included numerical integration, numerical differentiation, optimization, numerical solutions for ODEs, and other related concepts

**Teaching Assistant: Design of Steel Structures***California State University, Fresno (Spring 2012)*

As a teaching assistant for this undergraduate design course, I held weekly recitations that reviewed and emphasized critical concepts covered in lecture. The topics covered included design of tension members, columns, beams, connections, and design of members with combined loading.

**Tutor: Engineering, Science, and Mathematics***California State University, Fresno (Fall 2011 – Spring 2012)*

As a tutor, I provided personalized instruction to students in the Lyles College of Engineering. I tutored courses in mathematics, physics, chemistry, civil engineering, mechanical engineering and electrical engineering. I also provided general advice on study skills and test-taking strategies.

**Students Advised** 

---

**Undergraduates**

- Olivia Roy, *The Intersection of Gender and Emotion in Product Design*, October 2016 - Present
- Sydney Howard, *Machine Learning Applications to Engineering Design*, October 2016 - Present
- Frank Bello (co-advised with Shraddha Joshi), *Designing the Internet of Things with Varying Complexity*, August 2016 - Present
- June Williams (co-advised with Shraddha Joshi), *Investigating Human-Device Interaction in Connected Environments*, August 2016 - Present
- Guochen Shen (co-advised with Shraddha Joshi), *Internet of Things Devices: Usage in HVAC Systems and Optimization*, August 2015 – May 2016.
